

# Introduction to the HTML

Korzhumbayev Azamat

- When you connect to a web page by entering its URL into the browser
  - Browser instructs your computer to send a message out over the Internet to the computer specified by that URL requests that it sends back a certain document (**HTML source doc**)
  - **HTML source doc** describes the *content* and *layout* of the web page
  - After your computer receives the html, your browser interprets the html and displays the resulting web page (text/graphics/links etc)

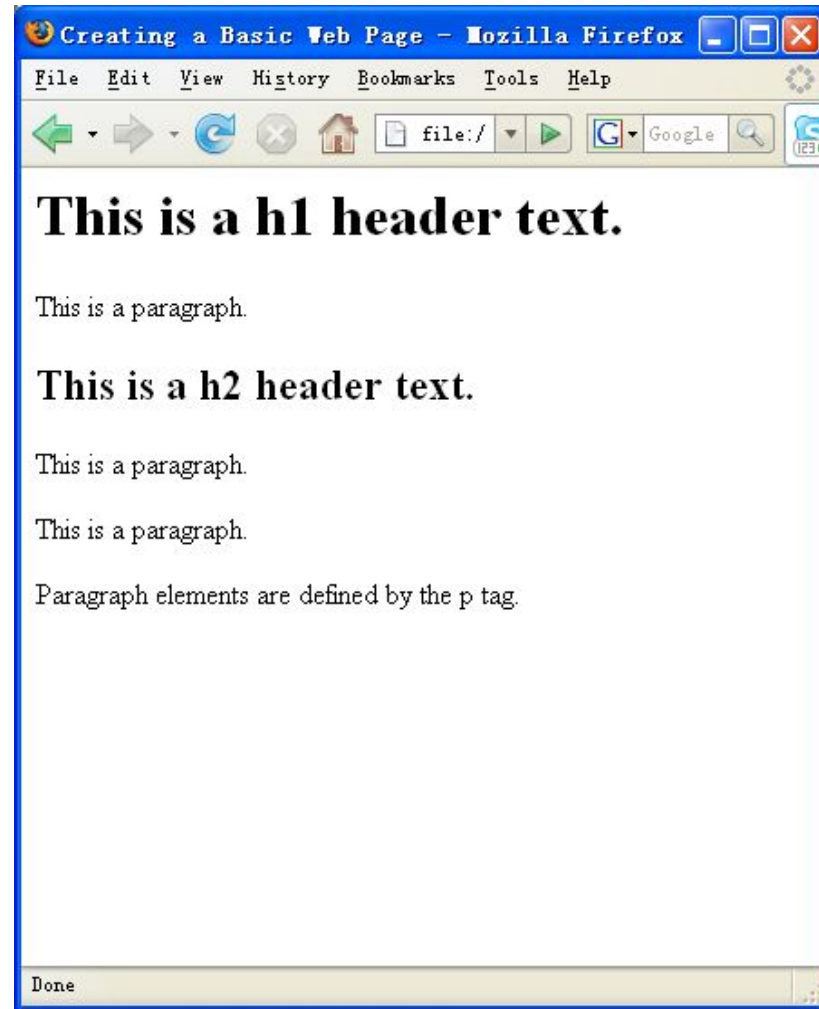

- **HTML** source document
  - A text-only document
  - Consists of (1) actual text, and (2) tags
- A **tag** is an html code that is enclosed in angel brackets `<>`; used to lay out the web page.
- **XHTML** is a simple, more standardized version of HTML
- XHTML/HTML can be created using a simple text editor like notepad
- File extension must be **.html** or **.htm**

# Sample HTML

```
1 <html>
2 <head>
3   <title>Creating a Basic Web Page</title>
4 </head>
5 <body>
6
7 <h1>This is a h1 header text.</h1>
8 <p>This is a paragraph.</p>
9 <h2>This is a h2 header text.</h2>
10 <p>This is a paragraph.</p>
11 <p>This is a paragraph.</p>
12
13 <p>Paragraph elements are defined by the p tag.</p>
14
15 </body>
16 </html>
```

HTML Source

Firefox display of the html source

- **XML** (eXtensible Markup Language):
  - is a **set of rules** that lets web designers classify their data in a way customized to their needs.
  - Extendable by creating new types of tags.
- **XHTML** (eXtensible HyperText Markup Language):
  - A new version of HTML based on XML
  - Inherits strict syntax rules of XML

- Some comparisons of HTML vs. XHTML

HTML	XHTML
Tags aren't extensible	Tags are extensible
Tags are not case-sensitive	Only lowercase tags are allowed
Possible to leave off and ending tag like <code>&lt;/body&gt;</code>	Tags should appear in pairs
Overlapping tags	No overlapping tags

- An HTML document consists of four main parts:
  - the DOCTYPE
  - the Html
  - the Head
  - the Body

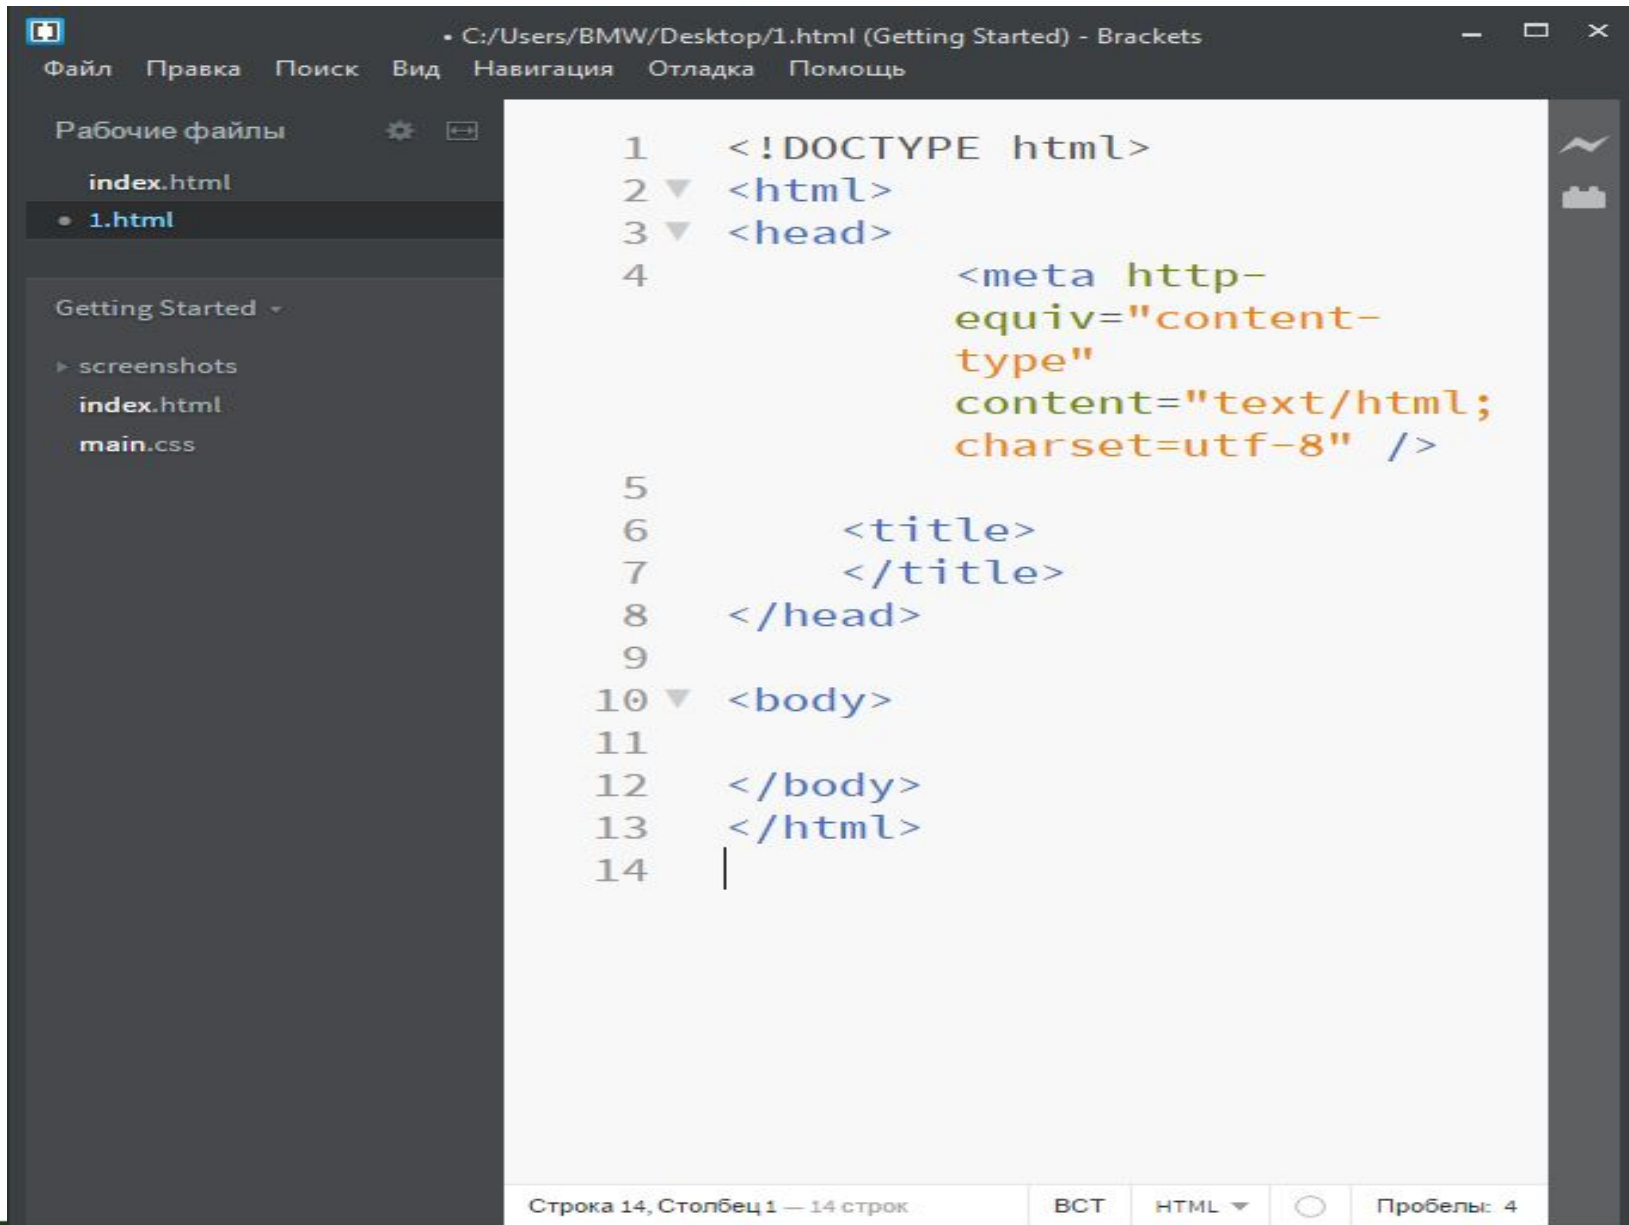

# Composition of a HTML Document

```
<!DOCTYPE html>
<html >
<head>
  <meta http-equiv="content-type" content="text/html;
charset=utf-8" />
  ...
  <title>...</title>
</head>

<body>
  ...
</body>
</html>
```

# Creating HTML

The screenshot shows the Brackets code editor interface. The title bar indicates the file path: C:/Users/BMW/Desktop/1.html (Getting Started) - Brackets. The menu bar includes options in Russian: Файл, Правка, Поиск, Вид, Навигация, Отладка, and Помощь. The left sidebar shows a file explorer with 'Рабочие файлы' (Working files) containing 'index.html' and '1.html', and a 'Getting Started' folder containing 'screenshots', 'index.html', and 'main.css'. The main editor area displays the following HTML code:

```
1  <!DOCTYPE html>
2  <html>
3  <head>
4      <meta http-
      equiv="content-
      type"
      content="text/html;
      charset=utf-8" />
5
6      <title>
7      </title>
8  </head>
9
10 <body>
11
12 </body>
13 </html>
14 |
```

The status bar at the bottom shows: Строчка 14, Столбец 1 — 14 строк (Line 14, Column 1 — 14 lines), ВСТ (UTF-8), HTML, and Пробелы: 4 (Spaces: 4).

- Tags are also called **elements**
- An **attribute** is a special code that can enhance or modify a tag. They are generally located in the starting tag after the tag name.
- Basic syntax for html tags and attr.
  - `<tag attribute="value"> </tag>`
  - All tags must be lower case and values of attributes need to be surrounded by quotes

- Example
  - `<strong>This is bold text...</strong>`
  - `<p style =“text-align:center”>This text will appear aligned to the center...</p>`

- <meta> tag
  - is used to specify *keywords* that describe a document's **contents** as well as a **short description**.
- Two necessary attributes – "name" & "content"

```
<meta name="keywords"  
      content="baseball, soccer, tennis"/>
```

```
<meta name="description"  
      content="Sports information page"/>
```

- <p> tag
  - The paragraph tag. Used so separate text within a web page.
  - Container type
  - Will provide line breaks
- Optional attribute : align (not supported in HTML5)

```
<p align="center">
```

- **<br/>** tag
  - Is used for line break
- Example

```
<p>  
Contact<br />  
6150 Sennott Square<br />  
University of Pittsburgh<br />  
Pittsburgh, PA 15260  
</p>
```

- **<h1>** to **<h6>**
  - Define headers. **<h1>** defines the largest header. **<h6>** defines the smallest header.
- Example

```
<h1>This is header 1</h1>
```

```
<h2>This is header 2</h2>
```

```
<h3>This is header 3</h3>
```

```
<h4>This is header 4</h4>
```

```
<h5>This is header 5</h5>
```

```
<h6>This is header 6</h6>
```

- **<em>** tag
  - Renders text as emphasized text
- **<strong>** tag
  - Renders text as strong emphasized text
- Example (with smth. missing)

```
<em>Emphasized text</em><br />
```

```
<strong>Strong text</strong><br />
```

- Comments are enclosed in `<!--` and `-->`
- Example

```
<!--This comment will not be  
displayed-->
```

```
<p>This is a regular paragraph</p>
```

What are the reasons for using comments?

- **<blockquote>** tag defines the start of a long quotation.

```
<blockquote cite=  
"http://www.forbes.kz/dollar.htm">  
here is a long quotation here is ...  
</blockquote>
```

- **<q>** tag defines the start of a long quotation.

```
<p><q cite="if any"> here is a short  
quotation</q> that helps you </p>
```
