

Global Issues and Threats

The background features a stylized landscape with green mountains, a bright orange sun, white clouds, and a blue body of water. The word "OIL" is prominently displayed in the upper center.

OIL

The last thing the world needs is more oil. As with other fossil fuels, our reliance on oil is fueling climate change, polluting priceless landscapes, and costing billions of dollars.

Fracking

Fracking is the fossil fuel industry's latest false solution to our energy challenge. It's more expensive, more polluting, and more dangerous than clean, renewable energy.

Nuclear Energy

A photograph of a nuclear power plant with several cooling towers emitting thick white steam into a blue sky with scattered clouds. In the foreground, there is a field of bright yellow flowers, possibly rapeseed. The overall scene is a juxtaposition of industrial activity and nature.

Nuclear energy has no place in a safe, clean, sustainable future. Nuclear energy is both expensive and dangerous, and just because nuclear pollution is invisible doesn't mean it's clean.

A photograph of a train of coal cars, viewed from an elevated angle. The cars are filled with dark coal, and the train is moving along tracks. The word "Coal" is overlaid in the center of the image in a large, black, sans-serif font.

Coal

Coal, the most polluting of all fossil fuels, is bad news for our health and the environment. The good news is people around the world are moving away from dirty, polluting coal in favor of clean, renewable, affordable energy.

Natural gas

NATURAL

Natural gas emits less carbon dioxide than coal and other fossil fuels. This has led to widespread support for replacing other fossil fuels with methane, the main component of natural gas.

Plastic Pollution

A large, sprawling pile of plastic waste, including bottles, containers, and other debris, stretches across the landscape under a dramatic sunset sky. The sun is low on the horizon, casting a warm, golden glow over the scene. The sky is filled with soft, wispy clouds, and the overall atmosphere is one of environmental devastation.

The equivalent of one garbage truck of plastic enters into our seas every minute, every day, all year long.

Forest Issues and Threats

The world's natural forests are hanging on by a thread. In places like Indonesia, central Africa, and the Amazon, forests are being cleared to make room for livestock, replaced by monocrops plantations of like soy and palm oil, exploited for timber, and withering from the impacts of climate change.

Oceans Issues & Threats

A large blue and white fishing vessel is seen from a low angle, with its mast and rigging visible against a clear sky. The vessel is surrounded by a massive flock of birds, likely terns, which are flying in all directions. The water in the foreground is dark and choppy, with many birds resting on the surface. The overall scene suggests a busy maritime environment, possibly a fishing ground.

For centuries, people have assumed that our vast ocean was limitless and immune to human impacts. It's only recently that scientists have come to understand the devastating effects we've already had on our seas.

Money in Politics

Around the country, communities are demanding progress on the issues that matter to them. A democracy crippled by special interests and corporate influence can't achieve this progress. Climate denying corporations and individuals are fighting against the changes we need by funneling money into political campaigns. It's time to take back the system.
