WHAT IS CHANGING ENVIRONMET?

Changing environment is a change or disturbance of the environment most often caused by human influences and natural ecological processes.

It can include any number of things, including natural disasters, human interferences, or animal interaction.

Causes of environmental change

Fishing

Forestry

Agriculture

Mining

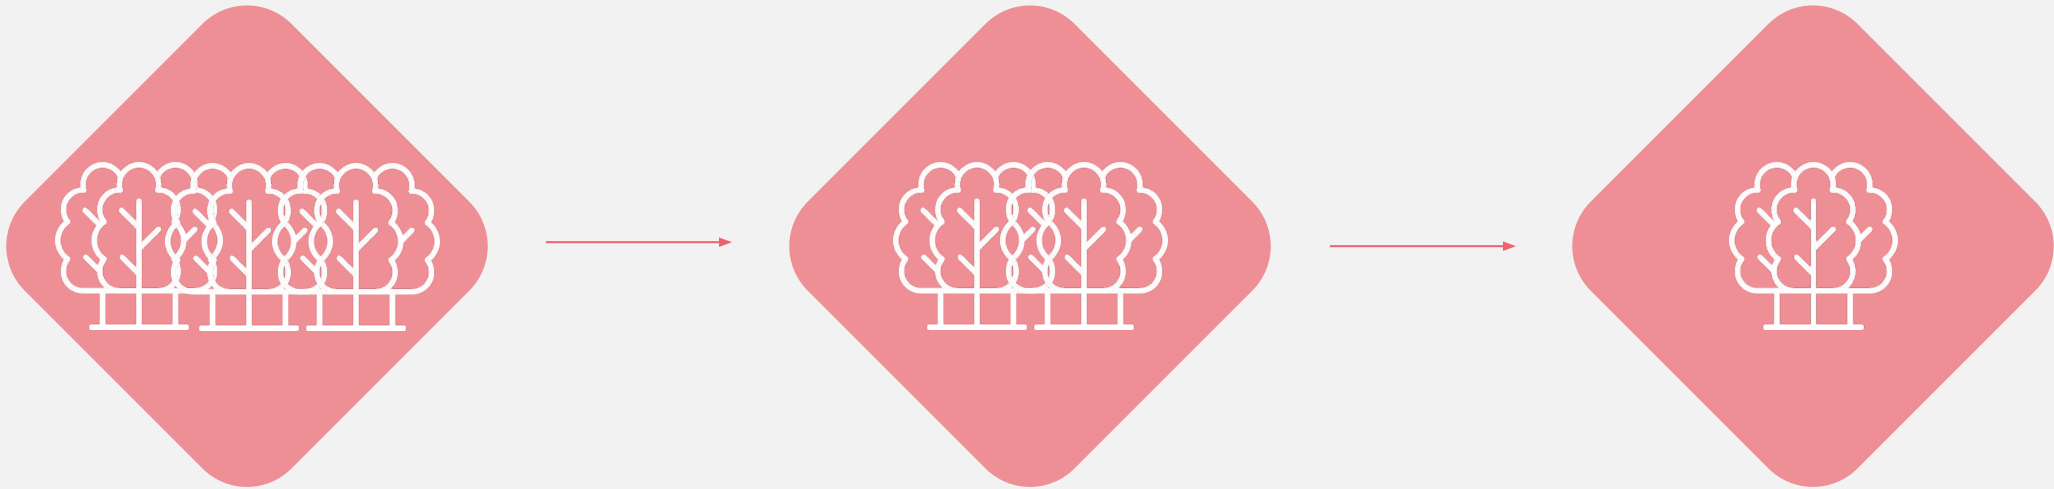

Urbanisation

Industry

Causes of environmental change

In the last 8000 years about 45% of the Earth's original forest cover has disappeared, most of which was cleared during the past century.

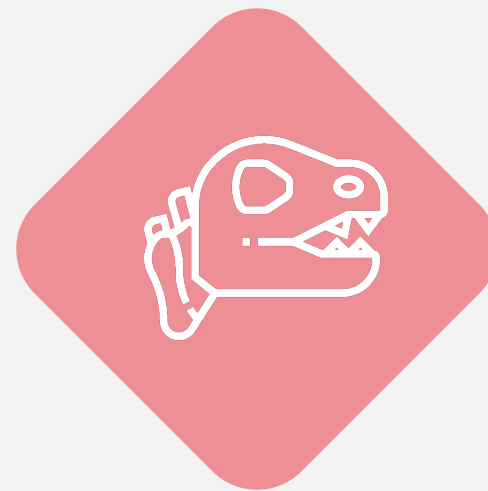

Causes of environmental change

The wild boars coming down to the city

Pollution to air, water and soil

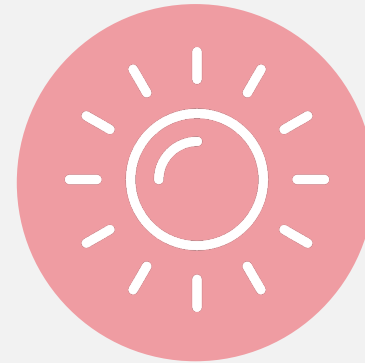

Extinction of species

Causes of environmental change

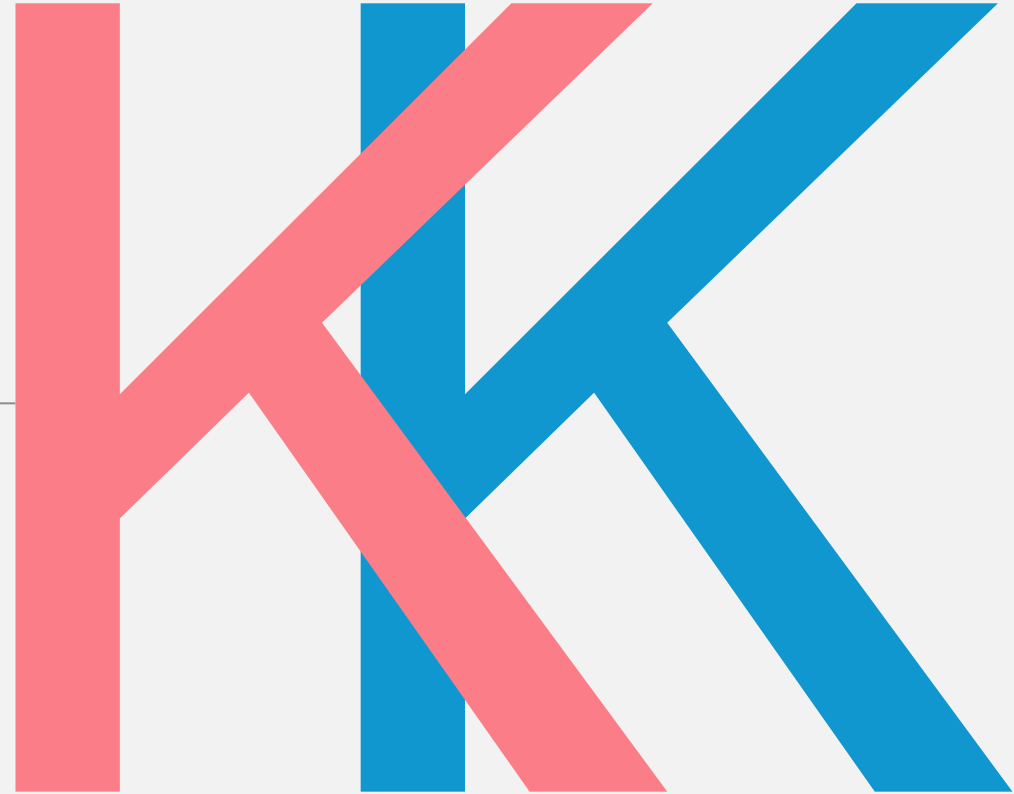

Volcanic eruptions can cause climate change if they release large amounts of sulfur dioxide high into the stratosphere.

The sunspot number, which increases every 11 years, confuses the Earth's magnetic field and causes climate change.
