Spring is a season. There are four seasons in a year, spring, summer, autumn and winter. Each season is marked by different weather and hours of daylight.

We have seasons because the earth takes a year to move round the sun, which gives us light and warmth, and because the earth tilts at an angle of 23.5 degrees. In winter we tilt away from the sun and in the summer we tilt further towards the sun. However, on the first day of spring the sun shines equally on both the north and south hemispheres of the Earth.

# Why do Plants Begin to Grow in Spring?

Plants need water, light, warmth and soil or compost to grow.

During spring they get the conditions they need to begin to grow. The showery weather gives them the water they need. The longer days mean they have more daylight and warmth from the Sun which raises the temperature of both air and soil.

# Spring Weather

Spring weather  
can be changable

sunny

windy

showery

cloudy

The weather in spring can be mixed. The end of March is often windy and April is known for its showery weather followed by sunshine. Right up to the end of May or into June spring nights can be frosty and cold. Days can be sunny and warm.

## **Calves are Born**

When it is spring many animals and birds have their babies. They need to have their young when there is lots of food available and when the longer days mean that they have longer to find food for their young. The warmer days and regular rainfall during spring means plants such as grass grow well. The lush, young grass in the fields mean the cow is well fed and can produce lots of milk for her calf.

## The Story of a Great Tit Nest

©2006 David Jones

Spring is the time that birds build their nests and have their chicks. They know that the days are beginning to get warmer and longer and that there will be plenty of food for their young. As the days get longer the parent birds have more time to hunt for food for their growing chicks.
