Moscow  
2016*

Alaska is known for its large glacial. The Mendenhall Glacier is a federally protected 12 mile long glacier in the Mendenhall Valley. It is recognized by the impressive caves it carries inside called the Ice Caves. To reach this caves, you will have to kayak, hike and climb the glacier. Not many people actually do this excursion but it is mesmerizing the view you will experience.

- As a consequence of Global Warming, the glaciers have started to melt and the caves were its product. The water carved caves in the interior, giving it the incredible turquoise-toned panorama. It's sad to know that this incredible place has its time counted. As the glacier keeps melting, this cave will soon disappear. The crazy thing is that as the Mendenhall Glacier melts and some caves disappear, a new panorama is forming, the Mendenhall Lake.
