Atom – the smallest unit of matter “indivisible”

Helium  
atom

# electron shells

- a) Atomic number = number of Electrons
- b) Electrons vary in the amount of energy they possess, and they occur at certain energy levels or **electron shells**.
- c) Electron shells determine how an atom behaves when it encounters other atoms

# Electrons are placed in shells according to rules:

- 1) The 1st shell can hold up to two electrons, and each shell thereafter can hold up to 8 electrons.

**Outermost electron shell (can hold 8 electrons)**

**First electron shell (can hold 2 electrons)**

**Electron**

**HYDROGEN (H)**  
Atomic number  
= 1

**CARBON (C)**  
Atomic number  
= 6

**NITROGEN (N)**  
Atomic number  
= 7

**OXYGEN (O)**  
Atomic number  
= 8

©Addison Wesley Longman, Inc.

Octet Rule = atoms tend to gain, lose or share electrons so as to have 8 electrons

✓ C would like to

Gain 4 electrons

✓ N would like to

Gain 3 electrons

✓ O would like to

Gain 2 electrons

# Why are electrons important?

1) Elements have different electron configurations

- different electron configurations mean different levels of bonding

# Periodic Chart of the Elements

2. Covalent bonds –
3. Metallic bonds

# Learning Check

A.  $\overset{\cdot}{\text{X}}$  would be the electron dot formula for

- 1) Na      2) K      3) Al

B.  $\overset{\cdot\cdot}{\underset{\cdot}{\text{X}}}$  would be the electron dot formula

- 1) B      2) N      3) P

# IONIC BOND

**bond formed between  
two ions by the  
*transfer* of electrons**

# Formation of Ions from Metals

- **Ionic compounds** result when **metals** react with **nonmetals**
- Metals *lose* electrons to match the *number of valence electrons* of their nearest noble gas
- *Positive ions* form *when* the number of electrons are **less** than the number of protons

Group 1 metals  $\longrightarrow$  **ion**  $^{1+}$

Group 2 metals  $\longrightarrow$  **ion**  $^{2+}$

• Group 13 metals  $\longrightarrow$  **ion**  $^{3+}$

# Some Typical Ions with Positive Charges (Cations)

**Group 1**      **Group 2**      **Group 13**

# Learning Check

**A. Number of valence electrons in aluminum**

- 1)  $1 e^-$       2)  $2 e^-$       3)  $3 e^-$

**B. Change in electrons for octet**

- 1) lose  $3e^-$       2) gain  $3 e^-$       3) gain  $5 e^-$

**C. Ionic charge of aluminum**

- 1)  $3^-$       2)  $5^-$       3)  $3^+$

# Solution

**A. Number of valence electrons in aluminum**

**3)  $3 e^-$**

**B. Change in electrons for octet**

**1) lose  $3e^-$**

**C. Ionic charge of aluminum**

**3)  $3^+$**

# Learning Check

Give the ionic charge for each of the following:

A.  $12 p^+$  and  $10 e^-$

1) 0      2) 2+      3) 2-

B.  $50p^+$  and  $46 e^-$

1) 2+      2) 4+      3) 4-

C.  $15 p^+$  and  $18e^-$

2) 3+      2) 3-      3) 5-

# Ions from Nonmetal Ions

- In ionic compounds, nonmetals in 15, 16, and 17 gain electrons from metals
- Nonmetal add electrons to achieve the octet arrangement
- Nonmetal ionic charge:  
3-, 2-, or 1-

# Fluoride Ion

unpaired electron

1<sup>-</sup>

**ionic charge**

# Ionic Bond

- Between atoms of metals and nonmetals with very different electronegativity
- Bond formed by transfer of electrons
- Produce charged ions all states. Conductors and have high melting point.
- Examples; NaCl, CaCl<sub>2</sub>, K<sub>2</sub>O

# Ionic Bonds: One Big Greedy Thief Dog!

Cl

Ionic Bonding

1). **Ionic bond** – electron from Na is transferred to Cl, this causes a charge imbalance in each atom. The Na becomes (Na<sup>+</sup>) and the Cl becomes (Cl<sup>-</sup>), charged particles or ions.

 Sodium ion ( $\text{Na}^+$ )

 Chloride ion ( $\text{Cl}^-$ )

# COVALENT BOND

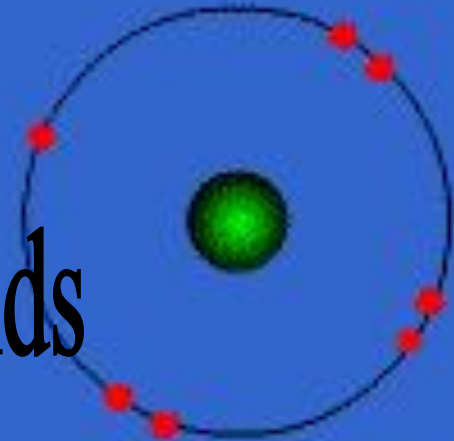

bond formed by the  
*sharing* of electrons

# Covalent Bond

- Between nonmetallic elements of similar electronegativity.
- Formed by sharing electron pairs
- Stable non-ionizing particles, they are not conductors at any state
- Examples;  $O_2$ ,  $CO_2$ ,  $C_2H_6$ ,  $H_2O$ ,  $SiC$

# Covalent Bonds

**Bonds in all the  
polyatomic ions  
and diatomics  
are all covalent  
bonds**

# NONPOLAR COVALENT BONDS

---

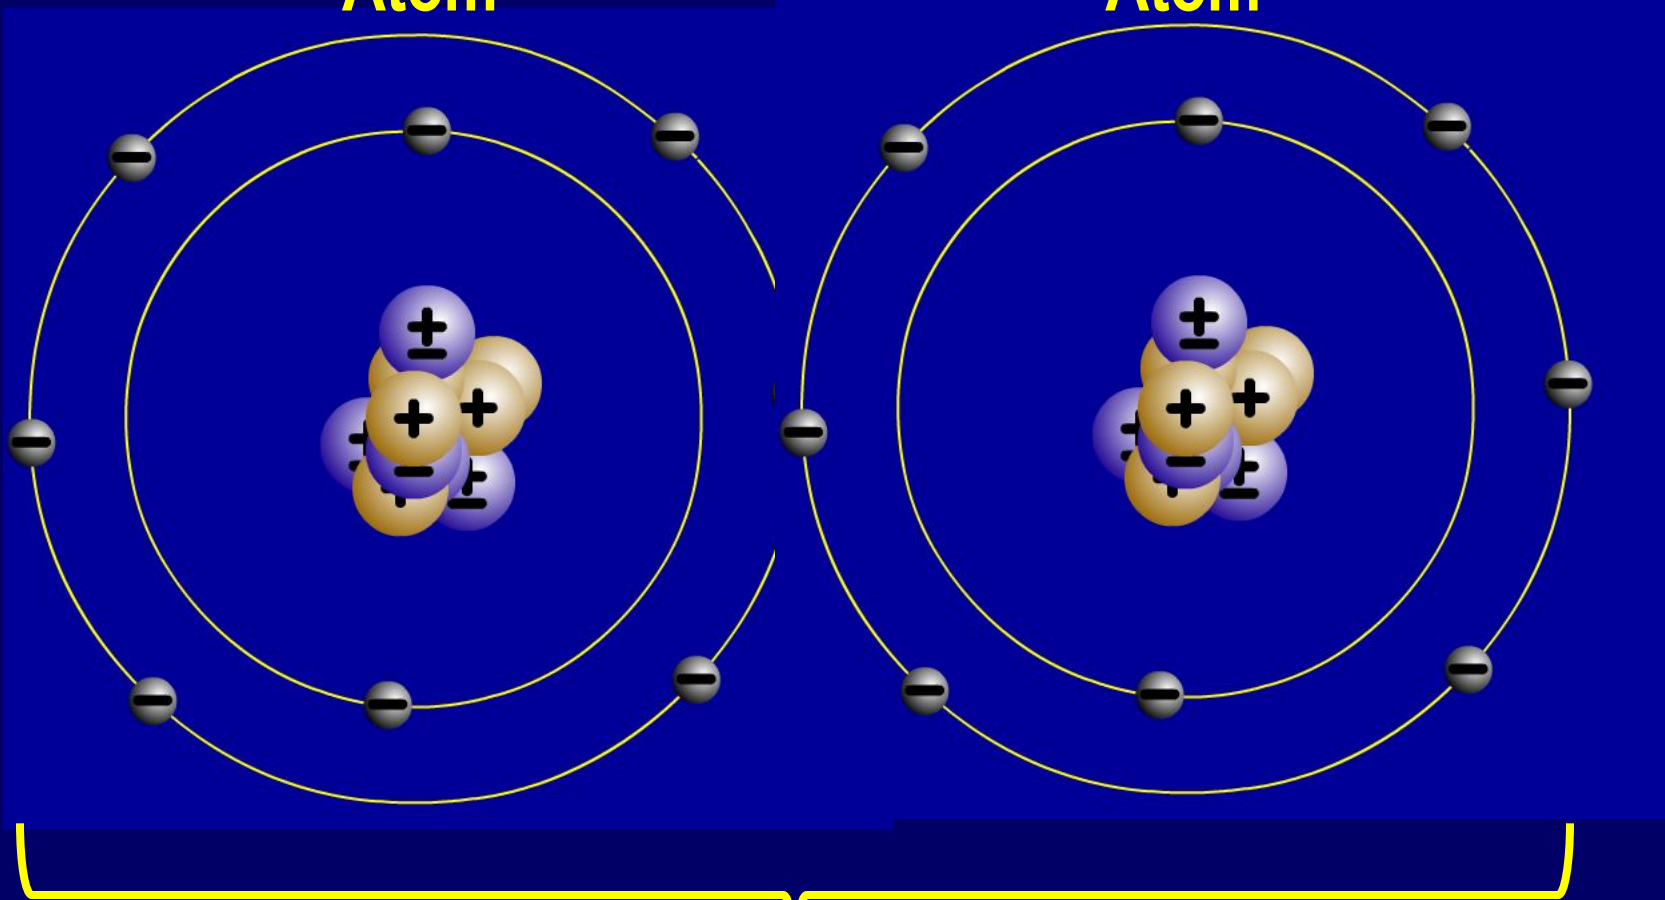

when electrons are  
shared *equally*

## 2. Covalent bonds- Two atoms share one or more pairs of outer-shell electrons.

Oxygen  
Atom

Oxygen  
Atom

Oxygen Molecule

(O<sub>2</sub>)

# POLAR COVALENT BONDS

---

when electrons are  
shared but shared  
*unequally*

# Polar Covalent Bonds: Unevenly matched, but willing to share.

©Addison Wesley Longman, Inc.

- water is a *polar molecule* because oxygen is more electronegative than hydrogen, and therefore electrons are pulled closer to oxygen.

# METALLIC BOND

**bond found in  
metals; holds metal  
atoms together  
very strongly**

# Metallic Bond

- Formed between atoms of metallic elements
- Electron cloud around atoms
- Good conductors at all states, lustrous, very high melting points
- Examples; Na, Fe, Al, Au, Co

**Metallic Bonds: Mellow dogs with plenty of bones to go around.**

©2000 ICS

# Ionic Bond, A Sea of Electrons

# Metals Form Alloys

Metals do not combine with metals. They form Alloys which is a solution of a metal in a metal. Examples are steel, brass, bronze and pewter.

# Formula Weights

- Formula weight is the sum of the atomic masses.

- Example-  $\text{CO}_2$

- Mass,  $\text{C} + \text{O} + \text{O}$

$$12.011 + 15.994 + 15.994$$

$$43.999$$

# Practice

- Compute the mass of the following compounds round to nearest tenth & state type of bond:
- NaCl;
- $23 + 35 = 58$ ; Ionic Bond
- $C_2H_6$ ;
- $24 + 6 = 30$ ; Covalent Bond
- $Na(CO_3)_2$ ;
- $23 + 2(12 + 3 \times 16) = 123$ ; Ionic & Covalent
