

Price elasticity of demand

Formula:

$$\frac{\Delta Q}{\text{mid}Q} : \frac{\Delta P}{\text{mid}P}$$

P price

Q quantity

ΔQ PERCENTAGE CHANGE IN
QUANTITY

ΔP PERCENTAGE CHANGE IN
PRICE

Inelastic (- 0.87) BECAUSE THE VALUE IS
NOT INCREASING

(authors calculation)

Income elasticity of demand

2019 – 2,320,000
2020 – 2,660,000
2021- 3,200,000

The formula for income elasticity is:

$$\Delta Q_s / Q_s / \Delta P / P$$

Finally, we got the answer that the income elasticity of demand is ELASTIC ($0, 12 < 1, 25$)

Moreover, we can understand that this good is positive=normal good , because in the answer there is NO negative sign
(Authors calculation)

(Sloman, J. and Garratt, D., (2019)

Cross-price elasticity

The substitute good for “turon uni” is the flor of “ motabar”

To estimate the percentage change in quantity the formula is $\frac{Q1-Q2}{Q2}$

Finally, the elasticity of income
 $0.2/0.1=1.81$
