

# Qlikview 11 Workshop

WITH ECRAFT DATA FROM SPECIAL LECTURE SEP 2015

RALF REHN

# The target of the Workshop

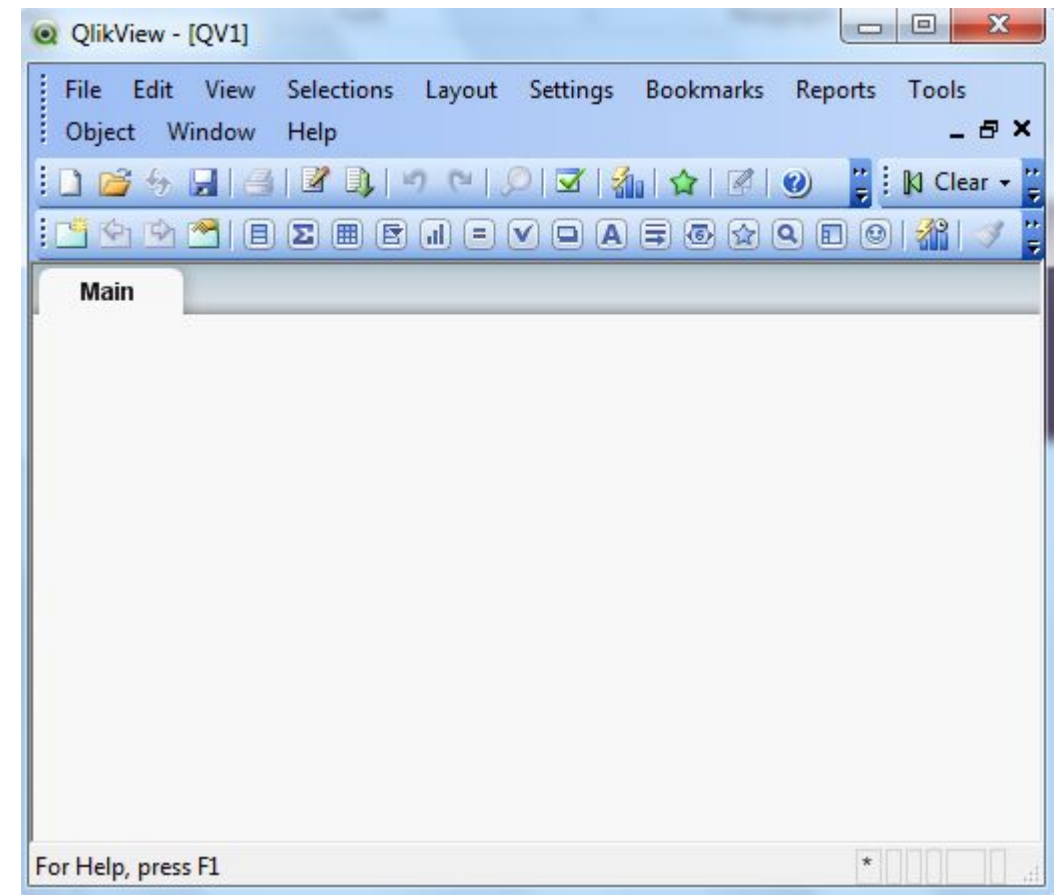

- ▶ To create a data model using the training material from the ECraft lecture (EXTRACT)
  - ▶ 5 Excel files
- ▶ To have the system create necessary relations
- ▶ To enhance analyzing by creating new fields (TRANSFORM)
  - ▶ Year
  - ▶ Month
- ▶ To create some analyzing objects
- ▶ To answer some business questions

# Things you need

- ▶ Download from Moodle the files
  - ▶ Salesdata
  - ▶ Customers
  - ▶ Customeraddress
  - ▶ Division
  - ▶ Region
- ▶ In Moodle also the corrected files
  - ▶ Customers\_corrected
  - ▶ Customeraddress\_corrected

# 1. Create a Qlikview 11 file

- ▶ **Locate Qlikview 11 on the computer and start it**
- ▶ **File – New**
- ▶ Abort the wizard by **Cancel**
- ▶ You have a empty Qlikview file
- ▶ **File – Save** – give a location and name

# 3. Extract the files into Qlikview

- ▶ 3.a **File - Edit Script**
- ▶ 3.b Choose **Table files** – Locate file - **Open**
- ▶ 3.c Check the settings depending on file and file structure
  - ▶ Excel file
  - ▶ Labels – Embeddes labels (means first row headers)
- ▶ 3.d Either **Finish** or go thru next screens by **Next** until end
- ▶ 3.e **Note** the SQL statement in the script
- ▶ 3.f **Rename** the datasource by adding a row after Directory end the name by : - example  
Salesdata:
- ▶ 3.g **Exit Edit script** with **Ok, IMPORTANT!** before loading data **FILE - SAVE**
- ▶ 3.h Read the datasource into memory by **File – Reload**
  - ▶ Check the your data model by File – **Table Viewer**
- ▶ Repeat for all files

## 3.a Editing the script

### File - Edit Script

Ensure the cursor is on a empty row  
like in the picture

Choose **Table files** – Locate file – **Open**  
to add a new datasource to the model

```
1 SET ThousandSep=' ';
2 SET DecimalSep=',';
3 SET MoneyThousandSep=' ';
4 SET MoneyDecimalSep=',';
5 SET MoneyFormat='# ##0,00 €;-# ##0,00';
6 SET TimeFormat='h:mm:ss';
7 SET DateFormat='D.M.YYYY';
8 SET TimestampFormat='D.M.YYYY h:mm:ss';
9 SET MonthNames='tammi;helmi;maaliskuu;huiv';
10 SET DayNames='ma;ti;ke;to;pe;la;su';
11
12 |
13
14
15
```

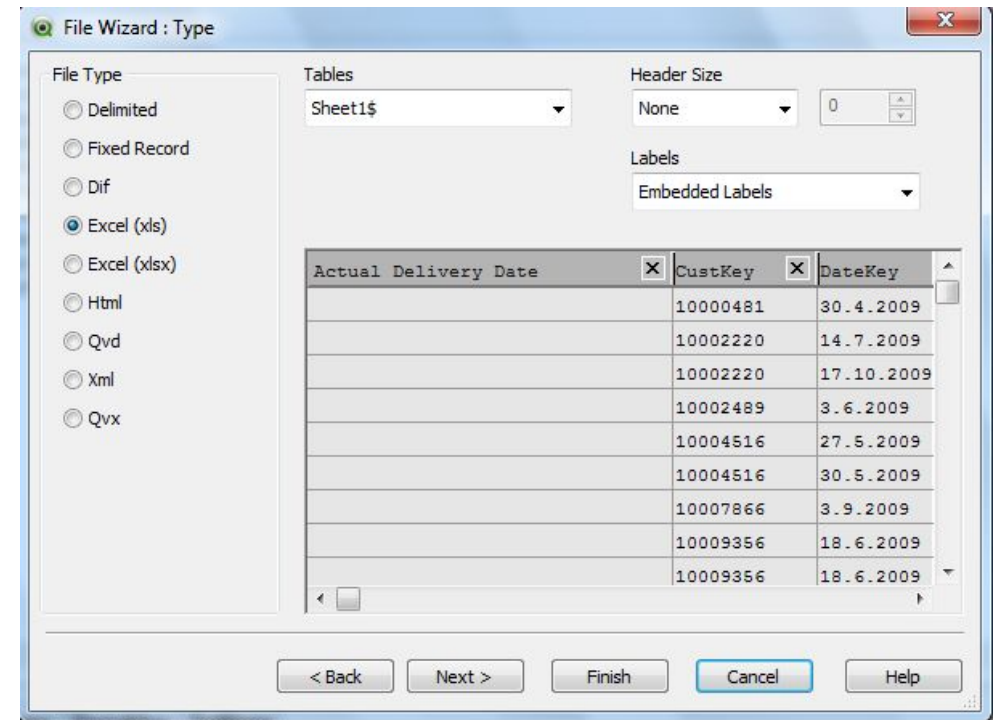

## 3.c Check the settings

Check the settings depending on file  
and file structure

- Excel file
- Labels – Embeddes labels (means first row  
headers)

Either **Finish** or go thru next screens by **Next** until end

**NOTE:** Files Region and Division  
need change in settings to Embedded Labels

## 3.e **Note** the SQL statement in the script

The script contains now the instructions  
For reading the data from the source

The script can be altered to do  
Transformations on data

```
Directory;  
LOAD [Actual Delivery Date],  
CustKey,  
DateKey,  
[Discount Amount],  
[Invoice Date],  
[Invoice Number],  
[Item Class],  
[Item Number],  
Item,  
[Line Number],  
[List Price],  
[Order Number],  
[Promised Delivery Date],  
[Sales Amount],  
[Sales Amount Based on List Price],  
[Sales Cost Amount],  
[Sales Margin Amount],  
[Sales Price],  
[Sales Quantity],  
[Sales Rep],  
[U/M]  
FROM
```

## 3.f Rename the datasource

**Rename** the datasource

by adding a row after Directory

End the name by :

- example Salesdata:

This is done to easier identify the source when working with the model

```
1  
2 Directory;  
3 Salesdata:  
4 LOAD [Actual Delivery Date],  
5     CustKey,  
6     DateKey,  
7     [Discount Amount],
```

## 3.g Save File before contnuing

**Exit Edit script** with **Ok**

**IMPORTANT!**

before loading data **FILE – SAVE**

**(If there is errors in script you could loose the changes since last Save)**

# 43.h Load the data and check the data model

**Read** the datasources into memory (actually executes the script!)

by **File – Reload**

**Check** your data model

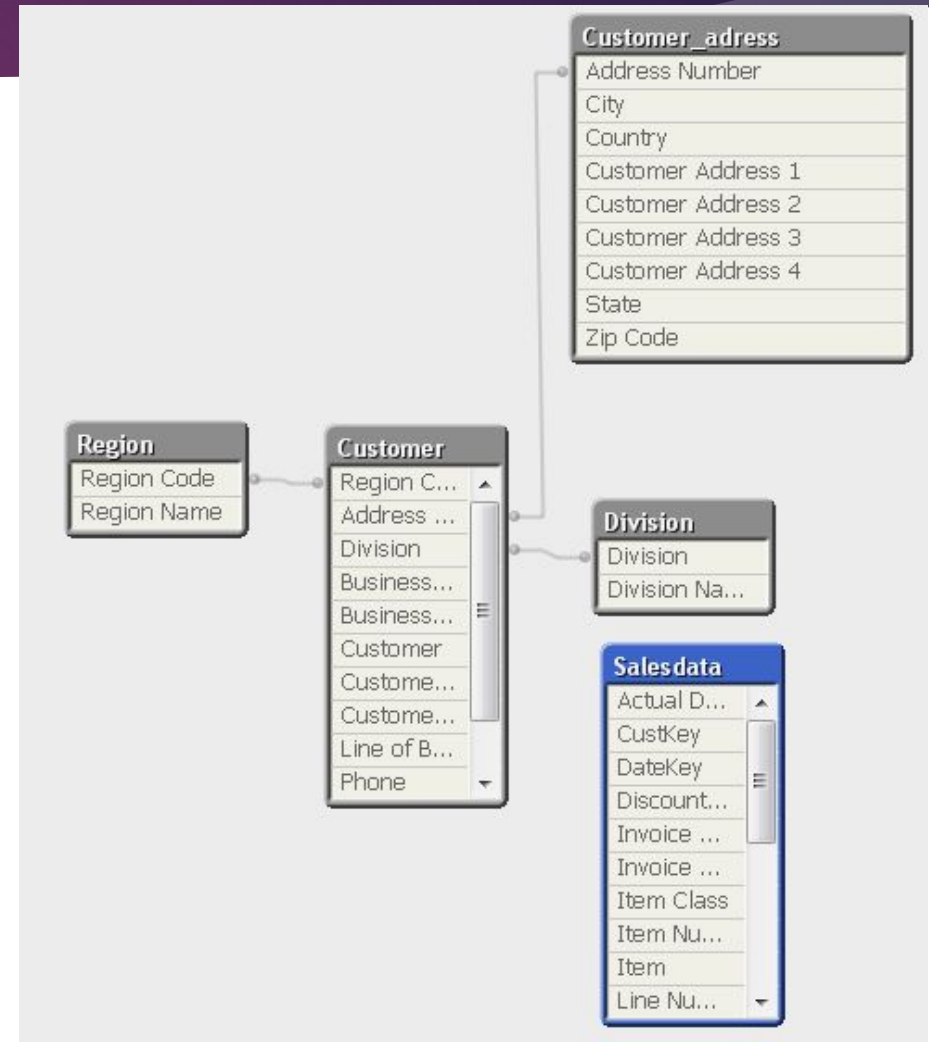

by **File – Table Viewer**

## 4. The Data model after all files loaded

Qlikview created automatically the relationships based on **common field names**

**However** as Salesdata and Customer do not have a common field  No relation created

**We need to edit the script**

## 5. Relate Salesdata and Customers

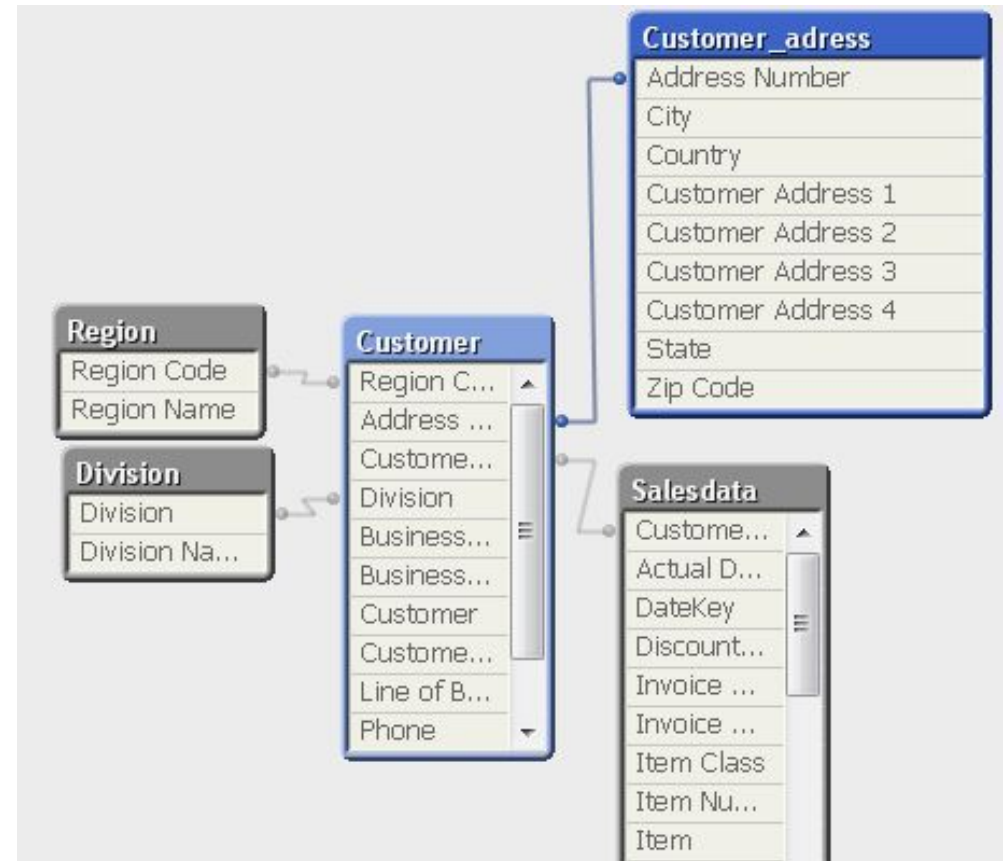

### Exercise - Transform

- Access the Table Viewer to check the current data model. Note that the Salesdata table is currently not linked
- Access the Script Editor
- Link the Sales and Customer Tables
  - Locate the field [Customer Number] in the Customer table and copy the name
  - Locate the field CustKey field in the Salesdata table and rename it Customer Number
- CustKey AS [Customer Number],

*From Tuukka Sarkkis presentation material*

# 6. Edit Script, Save ,Reload and check model again

```
SALESFACT,
Salesdata:
LOAD [Actual Delivery Date],
     CustKey as [Customer Number],
     DateKey,
     [Discount Amount],
```

## 7. Add new calculated fields

- Create the Year and Month fields based on the [Invoice Date] using the Year and Month functions
  - Copy the [Invoice Date] in the Salesdata table
  - On a new line in the script type:
    - Year([Invoice Date]) as Year
    - Month([Invoice Date]) as Month

*From Tuukka Sarkkis presentation material*

## 8. Change the script

```
Directory;  
Salesdata:  
LOAD [Actual Delivery Date],  
      CustKey as [Customer Number],  
      DateKey,  
      [Discount Amount],  
      [Invoice Date],  
      Year([Invoice Date]) as Year,  
      Month([Invoice Date]) as Month,  
      [Invoice Number],  
      [Item Class].
```

**Note** this is standard SQL query language check for instance out <http://www.w3schools.com/sql/>

# 9. The datamodel is ready

- ▶ After **Save** and **Reload**

# The business question

- ▶ How much has
  - ▶ The Customer "A1 Store"
  - ▶ bought
  - ▶ In June 2008
  - ▶ of Item "Even Better Blueberry Yogurt"
- ▶ ??
- ▶ Answer = Even Better Blueberry Yogurt 18870,57

# 10. Analyzing the data

- ▶ Add objects to the sheet
- ▶ Add sheets if wanted
- ▶ Save in between
  
- ▶ You can reset all filters with
- ▶ Clear in the ment

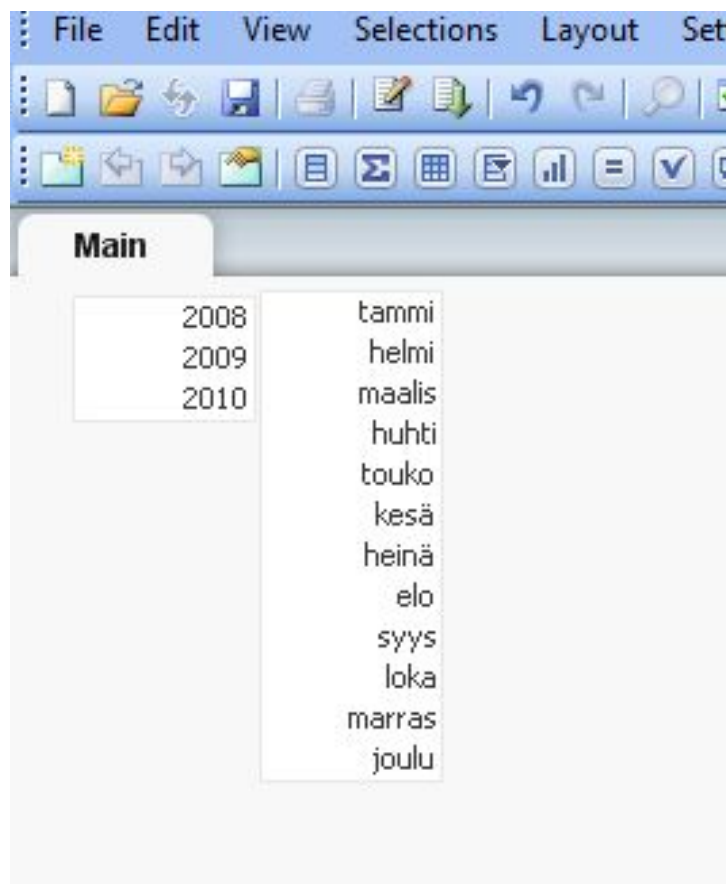

# 10. Analyzing the data

## Exercise- Interface

### Exercise - Listboxes as Calendar

- Right click in sheet and select option Select Fields
- Select Year and Month
- Access Properties - Presentation and uncheck the single column option for both listboxes
- De-select Show Caption on the Captions tab
- Resize and place the two listboxes across the top of the sheet

# 10. Calendar options created

# 10. Create Item/sales amount

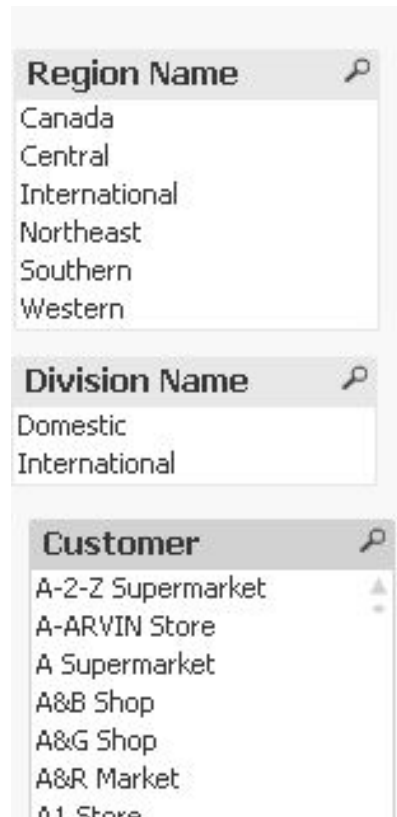

- ▶ **Right click** on Sheet – choose **New Sheet Object – Listbox**
- ▶ **Tab General**
  - ▶ **Title** "Sales per Item"
  - ▶ In **Field** choose **Item**
- ▶ **Tab Expressions**
  - ▶ **Add**
  - ▶ **Create formula** `sum([Sales Amount])`
  - ▶ Press **Ok**
- ▶ **Tab Number**
  - ▶ Choose format **Money**
- ▶ **Ok and resize object**

Sales Per Item	
American Beef Bologna	2730,18
American Chicken Hot Dogs	15242,09
American Cole Slaw	1584,69
American Corned Beef	384920,75
American Pimento Loaf	54702,82
American Potato Salad	45389,57
