- A computer is a digital electronic machine
 - A computer system is a "complete" computer that includes the hardware, operating system (main software)

Any digital computer carries out five functions in gross terms:

- ☐ Takes data as input.
- ☐ Stores the data/instructions in its memory and use them when required.
- ☐ Processes the data and converts it into useful information.
- ☐ Generates the output
- ☐ Controls all the above four steps

Processing → → → → → → → → → →
→ → → → → → → → → **Information**

Data

- We also have Input Devices

Keyboard Mouse (pointing device) Microphone Cameras and more

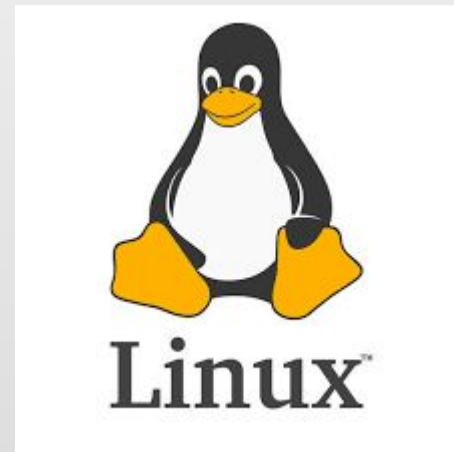

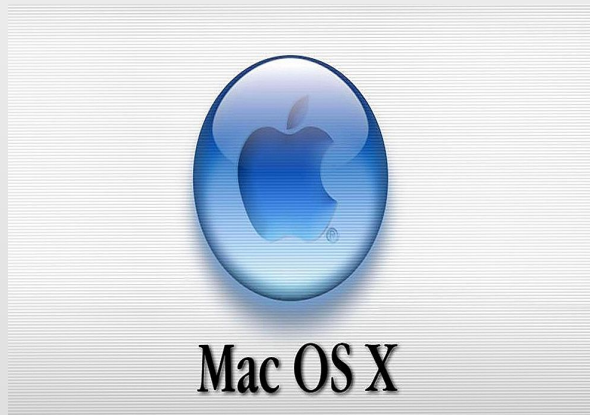

- System software Known as Operating System
- is responsible for controlling, integrating, and managing the individual hardware components of a computer system

- Windows is an example of OS
- example of System Software:

- 1) Microsoft Windows

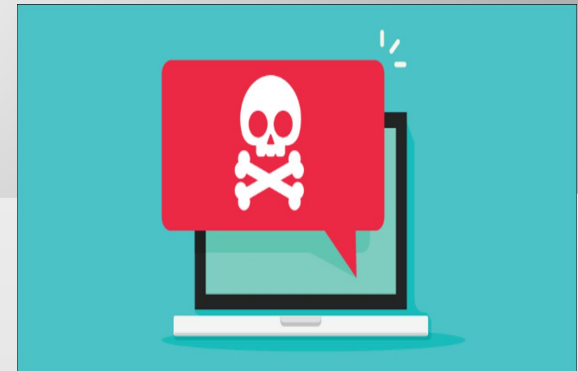

- 2) Linux
- 3) Unix
- 4) Mac OSX
- 5) DOS

using computer is very simple but there is also danger like **viruses**

They can be very danger for your pc but we can avoid them by just downloading antivirus programs

- We can download
- for example Avast
- which is very easy
- to use

- **Thanks for your time hope you enjoyed it**
