

Automate detection of current security threats

Stage 4 (the objectives of the study and/or its main findings)

The first step towards protecting information constituting confidential information is to identify current threats to information security by building a threat model.

Without knowledge of the actual security threats, it is impossible to build an adequate (from the point of view of monetary costs) information security system that ensures the security of confidential information, since only information security tools that neutralize current threats are included in the security system.

Stage 5 (the positive value of the research)

Given the increasing number of leaks of confidential information, the identification of current threats to the security of personal data when they are processed in personal data information systems is one of the main tasks of an information security specialist, and automation of this process will significantly accelerate the construction of a competent security system.
